

app folder

Contains GUI related functions that help updates the tables, and assign **worker** to run BSPSSEPy Engine.

config folder

Contains the code responsible for reading BSPSSEPy configuration python files and plan csv data. The code will parse the information and prepare all variables for BSPSSEPy simulation following the configuration parameters.

plot folder

Contains the code for plotting the results at the end of the simulation. These functions are projected to be refined and made more rich for better data visualization from within BSPSSEPy, but for now, a two simple plots are presented whenever the simulation **finishes successfully**. If data are to be plotted with incomplete simulation, use **MATLAB Code** to plot it (or view within PSSE -- check the manual)

psse folder

Contains the code for setting up the link between BSPSSEPy and PSSE to run the simulation. It configure PSSE for dynamic simulation following the settings in the Config file.

sim folder

Contains the BSPSSEPy simulation engine. The actual code that run the dynamic simulation. This code is setup to be called by the GUI (for realtime monitoring) or through the terminal using **bpssepy_terminal.py**.

bpssepy main folder python code

- **bpssepy_core.py**: main python class that will run the simulation and save data. It can be called by other python codes to setup the GUI or without GUI.
- **bpssepy_dict.py**: python code that contains dictionaries for various entries such as:
 - device type mapping (various entries that map to device types - i.e. **1**, **g**, **gen**, **generator** all maps to **GEN** type element)
 - action types (ON, OFF...etc.)
 - various variable names mapping to element actions
 - PSSE list of **callable** entries for each type of devices (used to check if the entry is available in PSSE and used as a quick reference for BSPSSEPy development).

- `bpssepy_funs_dict.py`: an element vs function mapping dictionary
- `meta.py`: Contains general meta data (date, version number...etc.) for BSPSSEPy GUI information.
